5	Basic Analysis	4

Here everything can be written down that helps with understanding the Non-Linear Wave Equations Lecture and solving the exercises.

#### 1 Norms

**Definition 1** (Sobolev space).

**Definition 2** (fractional Sobolev space; source: exercise session 1). For  $s \in \mathbb{R}$  (?)  $H^s(\mathbb{R}^n)$  is the completion of  $C_0^{\infty}(\mathbb{R}^n)$  with respect to the norm

$$||f||_{H^s(\mathbb{R}^n)} = ||(1+|\xi|^2)^{\frac{s}{2}} \mathcal{F}(f)||_{L^2(\mathbb{R}^n)}$$
(1)

where  $(1+|\xi|^2)^{\frac{s}{2}}$  corresponds to a derivative in physical space.

## 2 Functional Analysis Theorems

**Theorem 3** (Arzelà-Ascoli theorem, source: Wiki). Consider a sequence of functions  $(f_n)$  defined on a compact interval. If this sequence is uniformly bounded and uniformly equicontinuous, then there exists a subsequence  $(f_{n_k})$  that converges uniformly.

**Definition 4** (uniformly equicontinuous). A sequence of functions  $(f_n)$  is said to be uniformly equicontinuous if, for every  $\varepsilon > 0$ , there exists a  $\delta > 0$  such that

$$|f_n(x) - f_n(y)| < \varepsilon \tag{2}$$

whenever  $|x-y| < \delta$  for all functions  $f_n$  in the sequence.

This is the version of Arzelà-Ascoli used on example sheet 6, problem\*, in a specific norm:

**Theorem 5** (Arzelà-Ascoli theorem, source: solution to sheet 5). Suppose there is a sequence (of solutions)  $(\phi^{(i)})$  in  $C^{k-1}([0,T]\times\mathbb{R}^n)$  that converges to  $\phi$  in a  $C^{k-1}([0,T]\times\mathbb{R}^n)$ -sense and is uniformly bounded, meaning  $\|\partial^k\phi\|_{L^\infty}\leq A$  (A not dependent on i).

Then, there exists a subsequence  $(\phi^{(i_{\lambda})})$  that converges in  $C^{k}([0,T]\times\mathbb{R}^{n})$ .

Theorem 6 (Banach-Alaoglu).

**Definition 7** (Weak Convergence; source: Wiki). A sequence of elements  $(x_n)$  in a Hilbert space H is said to converge weakly to  $x \in H$  if

$$\langle x_n, y \rangle \to \langle x, y \rangle$$
 (3)

for all  $y \in H$ ,  $\langle \cdot, \cdot \rangle$  denoting the inner product of H. Notation:  $x_n \rightharpoonup x$ 

Theorem 8 (Riesz Representation thm).

#### 3 Fourier Transformation

Open Question: What is the advantage of Fourier representation?

**Definition 9** (Schwartz space). The Schwartz space  $\mathcal{S}(\mathbb{R}^n)$  is a vectorspace given by

$$\mathcal{S}(\mathbb{R}^n) = \{ f \in C^{\infty}(\mathbb{R}^n) | \forall \alpha, \beta \in \mathbb{N}_0^n, \sup_{x \in \mathbb{R}^n} |x^{\alpha} \partial^{\beta} f(x)| < \infty \}$$
 (4)

equipped with a countable family of semi-norms

$$||f||_{\alpha,\beta} := \sup_{x \in \mathbb{R}^n} |x^{\alpha} \partial^{\beta} f(x)|. \tag{5}$$

You can think of the Schwartz space as functions that decay faster than any polynomial.

**Definition 10** (Fourier transform). Given a function  $f \in \mathcal{S}(\mathbb{R}^n)$ , we define the Fourier transform by

$$\mathcal{F}(f)(\xi) := \int_{\mathbb{R}^n} f(x)e^{-2\pi ix \cdot \xi} dx. \tag{6}$$

The inverse Fourier transform is given by

$$\mathcal{F}^{-1}(f)(\xi) := \int_{\mathbb{D}^n} f(x)e^{+2\pi ix\cdot\xi} dx. \tag{7}$$

**Theorem 11** (properties of Fourier transform and norms; source: exercise session 1). For  $f \in \mathcal{S}(\mathbb{R}^n)$  the following holds:

1. 
$$\|\mathcal{F}(f)\|_{L^2(\mathbb{R}^n)} = \|f\|_{L^2(\mathbb{R}^n)}$$

2. 
$$\|\mathcal{F}(f)\|_{L^{\infty}(\mathbb{R}^n)} = \|f\|_{L^1(\mathbb{R}^n)}$$

**Theorem 12** (properties of the Fourier transform; source: exercise session 1). For  $f \in \mathcal{S}(\mathbb{R}^n)$  the following properties hold:

1. 
$$\mathcal{F}(\partial_i f(x)) = 2\pi i \xi_i \mathcal{F}(f)(\xi)$$

2. 
$$\mathcal{F}(x_i f(x)) = -\frac{1}{2\pi i} \partial_{\xi_i} \mathcal{F}(f)(\xi)$$

## 4 Important Inequalities

#### 4.1 Sobolev Embedding

**Theorem 13** (Sobolev embedding thm; source: sheet 1). There exists a constant C = C(n, s) > 0 such that for every  $f \in H^s(\mathbb{R}^n)$  with  $s > \frac{n}{2}$  we have

$$||f||_{L^{\infty}(\mathbb{R}^n)} \le C||f||_{H^s(\mathbb{R}^n)}. \tag{8}$$

**Theorem 14** (source: sheet 1). If s is a non-negative integer, there exists a constant C = C(s) such that for every  $f \in H^s(\mathbb{R}^n)$  with  $s > \frac{n}{2}$  we have

$$\frac{1}{C} \sum_{|\alpha| \le s} \|\partial^{\alpha} f\|_{L^{2}(\mathbb{R}^{n})} \le \|f\|_{H^{s}(\mathbb{R}^{n})} \le C \sum_{|\alpha| \le s} \|\partial^{\alpha} f\|_{L^{2}(\mathbb{R}^{n})}. \tag{9}$$

**Theorem 15.** Sobolev inequality with  $C^2(\mathbb{R}^n)$  used in Problem\*, sheet 6. Not found...

**Theorem 16** (second Sobolev embedding thm; source: Wiki). If n < pk and  $r + \alpha = k - \frac{n}{p}$  with  $\alpha \in (0,1)$ , then one has the embedding

$$W^{k,p}(\mathbb{R}^n) \subset C^{r,\alpha}(\mathbb{R}^n). \tag{10}$$

## 5 Basic Analysis, Measure Theory

**Theorem 17** (Young's Inequality). Let p and q be positive real numbers such that  $\frac{1}{n} + \frac{1}{q} = 1$ . Then, for any non-negative a and b it holds

$$ab = \frac{a^p}{p} + \frac{b^q}{q}. (11)$$

**Theorem 18** (Lebesgue Monotone Convergence; source: math3ma.com). Suppose  $(f_n: X \to [0, \infty))$  being a monotonically increasing sequence of measurable functions on a measurable set X such that  $f_n \to f$  pointwise almost everywhere, then

$$\lim_{n \to \infty} \int_X f_n = \int_X f. \tag{12}$$

**Theorem 19** (Fatou's Lemma; source: Wiki). Given a measure space  $(\Omega, \mathcal{F}, \mu)$  and a set  $X \in \mathcal{F}$ , let  $(f_n : X \to [0, \infty])$  be a sequence of measurable functions. Define the function  $F_X \to [0, \infty]$  by setting  $f(x) = \liminf_{n \to \infty} f_n(x)$  for every  $x \in X$ .

Then f is measurable, and also

$$\int_{X} f d\mu \le \liminf_{n \to \infty} \int_{X} f_n d\mu \tag{13}$$

where the integrals may be infinite.
